256 x 4 Bit

Nonvolatile Static RAM

1

FEATURES

- Single 5V Supply
- Fully TTL Compatible
- Infinite E²PROM Array Recall, RAM Read and Write Cycles
- Access Time of 300 ns Max.
- Nonvolatile Store Inhibit: V_{CC} = 3V Typical
- High Reliability
 - Store Cycles: 100,000
 - Data Retention: 100 Years
- JEDEC Standard 18-Pin Package

DESCRIPTION

The Xicor X2212 is a 256 x 4 NOVRAM featuring a high-speed static RAM overlaid bit-for-bit with a nonvolatile E²PROM. The X2212 is fabricated with the same reliable N-channel floating gate MOS technology used

in all Xicor 5V nonvolatile memories. The X2212 features the JEDEC approved pinout for 4-bit-wide memories, compatible with industry standard RAMs.

The NOVRAM design allows data to be easily transferred from RAM to E²PROM (store) and from E²PROM to RAM (recall). The store operation is completed in 10 ms or less and the recall is typically completed in 1 μs.

Xicor NOVRAMs are designed for unlimited write operations to RAM, either from the host or recalls from E²PROM. The E²PROM array is designed for a minimum 100,000 store cycles and inherent data retention is specified to be greater than 100 years. Refer to RR-520 and RR-515 for details on Xicor nonvolatile memory endurance and data retention characteristics.

*COMMENT

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and the functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PIN DESCRIPTIONS AND DEVICE OPERATION

Addresses (A₀–A₇)

The address inputs select a 4-bit memory location during a read or write operation.

Chip Select (\overline{CS})

The Chip Select input must be LOW to enable read/write operations with the RAM array. \overline{CS} HIGH will place the I/O pins in the high impedance state.

Write Enable (\overline{WE})

The Write Enable input controls the I/O buffers, determining whether a RAM read or write operation is enabled. \overline{WE} HIGH enables a read and \overline{WE} LOW enables a write.

Data In/Data Out (I/O₁–I/O₄)

Data is written to or read from the X2212 through the I/O pins. The I/O pins are placed in the high impedance state when either \overline{CS} is HIGH or during either a store or recall operation.

STORE

The \overline{STORE} input, when LOW, will initiate the transfer of the entire contents of the RAM array to the E²PROM array. The \overline{WE} and ARRAY RECALL inputs are inhibited during the store cycle. The store operation will be completed in 10 ms or less.

A store operation has priority over RAM read/write operations. If \overline{STORE} is asserted during a read operation, the read will be discontinued. If \overline{STORE} is asserted during a RAM write operation, the write will be immediately terminated and the store performed. The data at the RAM address that was being written will be unknown in both the RAM and E²PROM.

ARRAY RECALL

The ARRAY RECALL input, when LOW, will initiate the transfer of the entire contents of the E²PROM array to the RAM array. The transfer of data will typically be completed in 1 μ s or less.

An array recall has priority over RAM read/write operations and will terminate both operations when ARRAY RECALL is asserted. ARRAY RECALL LOW will also inhibit the \overline{STORE} input.

WRITE PROTECTION

The X2212 has three write protect features that are employed to protect the contents of the nonvolatile memory.

- **V_{CC} Sense**—All functions are inhibited when V_{CC} is $\leq 3V$, typically.
- **Write Inhibit**—Holding either \overline{STORE} HIGH or ARRAY RECALL LOW during power-up or power-down will prevent an inadvertent store operation and E²PROM data integrity will be maintained. It should be noted; whichever method is employed, all control inputs should be stable and the device deselected prior to release of the controlling protection signal.
- **Noise Protection**—A \overline{STORE} pulse of less than 20 ns (typical) will *not* initiate a store cycle.
