

## GaAs PHEMT MMIC LOW NOISE AGC AMPLIFIER, 2.0 - 20.0 GHz

### Typical Applications

The HMC463 is ideal for:

- Telecom Infrastructure
- Microwave Radio & VSAT
- Military & Space
- Test Instrumentation
- Fiber Optics

### Functional Diagram

### Features

- Gain: 14 dB
- Noise Figure: 2.5 dB @ 10 GHz
- P1dB Output Power: +19 dBm @ 10 GHz
- Supply Voltage: +5.0V @ 60 mA
- 50 Ohm Matched Input/Output
- 3.15 mm x 1.63 mm x 0.1 mm

### General Description

The HMC463 is a GaAs MMIC PHEMT Low Noise AGC Distributed Amplifier die which operates between 2 and 20 GHz. The amplifier provides 14 dB of gain, 2.5 dB noise figure and 19 dBm of output power at 1 dB gain compression while requiring only 60 mA from a +5V supply. An optional gate bias (Vgg2) is provided to allow Adjustable Gain Control (AGC) of 10 dB typical. Gain flatness is excellent at  $\pm 0.15$  dB from 6 - 18 GHz making the HMC463 ideal for EW, ECM and RADAR applications. The HMC463 amplifier can easily be integrated into Multi-Chip-Modules (MCMs) due to its small size. All data is with the chip in a 50 Ohm test fixture connected via 0.025mm (1 mil) diameter wire bonds of minimal length 0.31mm (12 mils).

### Pad Descriptions

Pad Number	Function	Description	Interface Schematic
1	RFIN	This pad is AC coupled and matched to 50 Ohms from 2.0 - 20.0 GHz	
2	Vgg2	Optional gate control if AGC is required. Leave Vgg2 open circuited if AGC is not required.	
3	Vdd	Power supply voltage for the amplifier. External bypass capacitors are required	
4	RFOUT	This pad is AC coupled and matched to 50 Ohms from 2.0 - 20.0 GHz	
5	Vgg1	Gate control for amplifier. Adjust to achieve Idd= 60 mA.	
Die Bottom	GND	Die bottom must be connected to RF/DC ground.

**Mounting & Bonding Techniques for Millimeterwave GaAs MMICs**

The die should be attached directly to the ground plane with conductive epoxy (see HMC general Handling, Mounting, Bonding Note).

50 Ohm Microstrip transmission lines on 0.127mm (5 mil) thick alumina thin film substrates are recommended for bringing RF to and from the chip (Figure 1). If 0.254mm (10 mil) thick alumina thin film substrates must be used, the die should be raised 0.150mm (6 mils) so that the surface of the die is coplanar with the surface of the substrate. One way to accomplish this is to attach the 0.102mm (4 mil) thick die to a 0.150mm (6 mil) thick molybdenum heat spreader (moly-tab) which is then attached to the ground plane (Figure 2).

Microstrip substrates should be brought as close to the die as possible in order to minimize bond wire length. Typical die-to-substrate spacing is 0.076mm to 0.152 mm (3 to 6 mils).

**GaAs PHEMT MMIC LOW NOISE  
AGC AMPLIFIER, 2.0 - 20.0 GHz****Handling Precautions**

*Follow these precautions to avoid permanent damage.*

**Cleanliness:** Handle the chips in a clean environment. DO NOT attempt to clean the chip using liquid cleaning systems.

**Static Sensitivity:** Follow ESD precautions to protect against  $> \pm 250V$  ESD strikes.

**Transients:** Suppress instrument and bias supply transients while bias is applied. Use shielded signal and bias cables to minimize inductive pick-up.

**General Handling:** Handle the chip along the edges with a vacuum collet or with a sharp pair of bent tweezers. The surface of the chip has fragile air bridges and should not be touched with vacuum collet, tweezers, or fingers.

**Mounting**

*The chip is back-metallized and can be die mounted with electrically conductive epoxy. The mounting surface should be clean and flat.*

**Epoxy Die Attach:** Apply a minimum amount of epoxy to the mounting surface so that a thin epoxy fillet is observed around the perimeter of the chip once it is placed into position. Cure epoxy per the manufacturer's schedule.

**Wire Bonding**

Ball or wedge bond with 0.025mm (1 mil) diameter pure gold wire. Thermosonic wirebonding with a nominal stage temperature of 150 deg. C and a ball bonding force of 40 to 50 grams or wedge bonding force of 18 to 22 grams is recommended. Use the minimum level of ultrasonic energy to achieve reliable wirebonds. Wirebonds should be started on the chip and terminated on the package or substrate. All bonds should be as short as possible  $< 0.31mm$  (12 mils).
