KA350

3-Terminal 3A Positive Adjustable Voltage Regulator

Features

- Output adjustable between 1.2V and 33V
- Guaranteed 3A output current
- Internal thermal over load protection
- Load regulation (Typ: 0.1%)
- Line regulation (Typ: 0.015%/V)
- Internal short circuit current limit
- Output transistor safe area compensation

Description

The KA350 is an adjustable 3-terminal positive voltage regulator capable of supplying in excess of 3.0 A over an output voltage range of 1.2V to 33 V

Typical Application

C_I : C_I is required if the regulator is located an appreciable distance from power supply filter.
C_O : Output capacitors in the range of 1μF to 100μF of aluminum or tantalum capacitor are commonly used to provide improved output impedance and rejection of transients.

In operation, the KA350 develops a nominal 1.25V reference voltage, V_{REF}, between the output and adjustment terminal. The reference voltage is impressed across program resistor R_1 and, since the voltage is constant, a constant current I_1 then flows through the output set resistor R_2, giving an output voltage of

$$V_O = 1.25V(1+R_2/R_1) + I_{ADJ} R_2$$

Since I_{ADJ} current (less than 100μF) from the adjustment terminal represents an error term, the KA350 was designed to minimize I_{ADJ} and make it very constant with line and load changes. To do this, all quiescent operating current is returned to the output establishing a minimum load current requirement. If there is insufficient load on the output, the output voltage will rise.

Since the KA350 is a floating regulator, it is only the voltage differential across the circuit which is important to performance, and operation at high voltage with respect to ground is possible.

Since I_{ADJ} is controlled to less than 100μA, the error associated with this term is negligible in most applications.
