

# ST7263B

## LOW SPEED USB 8-BIT MCU FAMILY WITH FLASH/ROM, UP TO 512 BYTES RAM, 8-BIT ADC, WDG, TIMER, SCI & I C

DATA BRIEFING

### ■ Memories

- 4, 8 or 16 Kbytes Program Memory: High Density Flash (HDFlash) or ROM with Read-out and Write Protection
- In-Application Programming (IAP) and In-Circuit programming (ICP) for HDFlash devices
- 384 or 512 bytes RAM memory (128-byte stack)

### ■ Clock, Reset and Supply Management

- Run, Wait, Slow and Halt CPU modes
- 12 or 24 MHz Oscillator
- RAM Retention mode
- Optional Low Voltage Detector (LVD)

### ■ USB (Universal Serial Bus) Interface

- DMA for low speed applications compliant with USB 1.5 Mbs (version 1.1) and HID specifications (version 1.0)
- Integrated 3.3 V voltage regulator and transceivers
- Suspend and Resume operations
- 3 Endpoints with programmable In/Out configuration

### ■ 19 I/O Ports

- 8 high sink I/Os (10 mA at 1.3 V)
- 2 very high sink true open drain I/Os (25 mA at 1.5 V)
- 8 lines individually programmable as interrupt inputs

### ■ 2 Timers

- Programmable Watchdog
- 16-bit Timer with 2 Input Captures, 2 Output Compares, PWM output and clock input

### ■ 2 Communications Interfaces

- Asynchronous Serial Communications Inter-

face (on K4 and K2 versions only)

- I C Multi Master Interface up to 400 kHz (on K4 versions only)

### ■ 1 Analog Peripheral

- 8-bit A/D Converter (ADC) with 8 channels

### ■ Instruction Set

- 63 basic instructions
- 17 main addressing modes
- 8 x 8 unsigned multiply instruction
- True bit manipulation

### ■ Development Tools

- Versatile Development Tools (under Windows) including assembler, linker, C-compiler, archiver, source level debugger, software library, hardware emulator, programming boards and gang programmers

Table 1. Device Summary

Features	ST72F63BK4	ST7263BK2	ST7263BK1
Program Memory -bytes-	16K (Flash)	8K (Flash or ROM)	4K (Flash or ROM)
RAM (stack) - bytes	512 (128)	384 (128)	
Peripherals	Watchdog timer, 16-bit timer, SCI, I C, ADC, USB	Watchdog timer, 16-bit timer, SCI, ADC, USB	Watchdog, 16-bit timer, ADC, USB
Operating Supply	4.0 V to 5.5 V		
CPU frequency	8 MHz (with 24 MHz oscillator) or 4 MHz (with 12 MHz oscillator)		
Operating temperature	0 °C to +70 °C		
Packages	SO34/SDIP32

### 1 INTRODUCTION

The ST7263B Microcontrollers form a sub-family of the ST7 MCUs dedicated to USB applications. The devices are based on an industry-standard 8-bit core and feature an enhanced instruction set. They operate at a 24 MHz or 12 MHz oscillator frequency. Under software control, the ST7263B MCUs may be placed in either Wait or Halt modes, thus reducing power consumption. The enhanced instruction set and addressing modes afford real programming potential. In addition to standard 8-bit data management, the ST7263B MCUs feature true bit manipulation, 8x8 unsigned multiplication and indirect addressing modes. The devices include an ST7 Core, up to 16 Kbytes of program memory, up to 512 bytes of RAM, 19 I/O lines and the following on-chip peripherals:

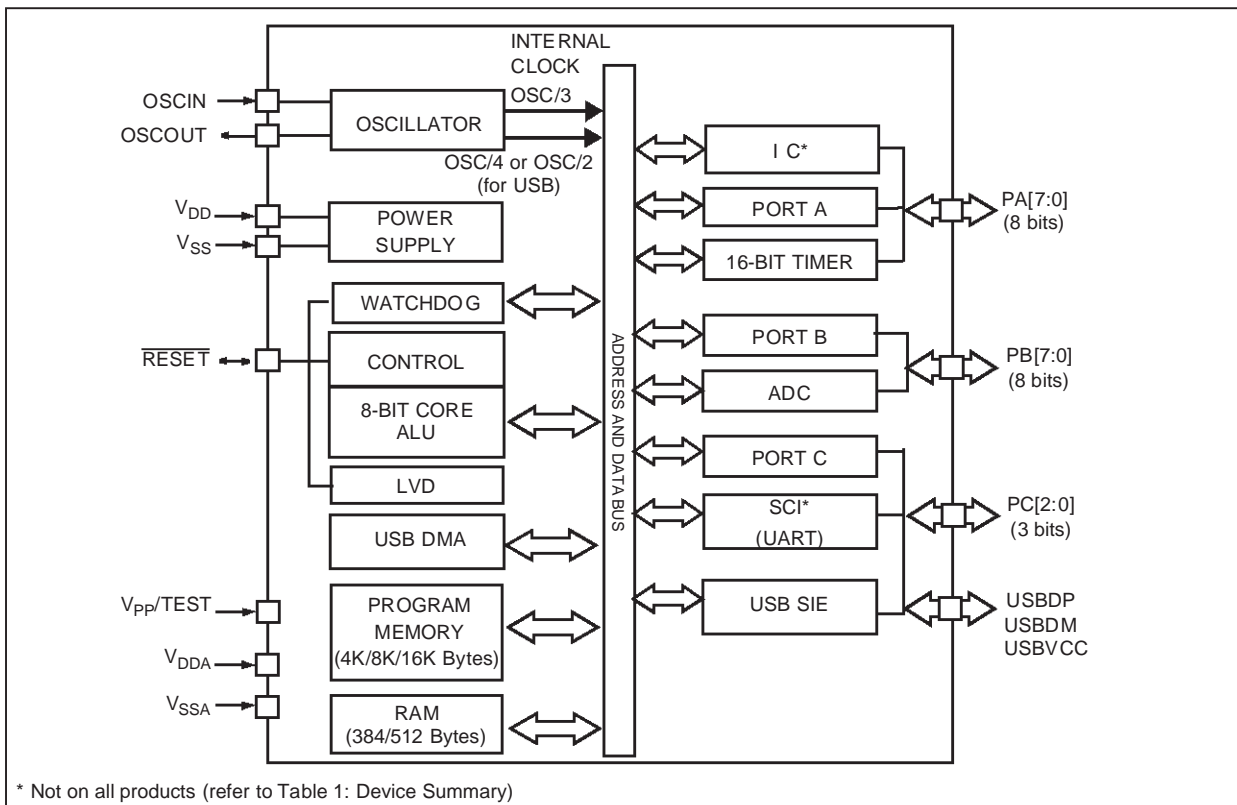

- USB low speed interface with 3 endpoints with programmable in/out configuration using the DMA architecture with embedded 3.3V voltage regulator and transceivers (no external components are needed).

- 8-bit Analog-to-Digital converter (ADC) with 8 multiplexed analog inputs
- Industry standard asynchronous SCI serial interface (not on all products - see Table 1 Device Summary)
- Watchdog
- 16-bit Timer featuring an External clock input, 2 Input Captures, 2 Output Compares with Pulse Generator capabilities
- Fast I C Multi Master interface (not on all products - see device summary)
- Low voltage reset (LVD) ensuring proper power-on or power-off of the device

All ST7263B MCUs are available in ROM or Flash versions.

Flash devices support programming in IAP mode (In-application programming) via the on-chip USB interface.

## 2 PIN DESCRIPTION

Figure 2. 34-Pin SO Package Pinout

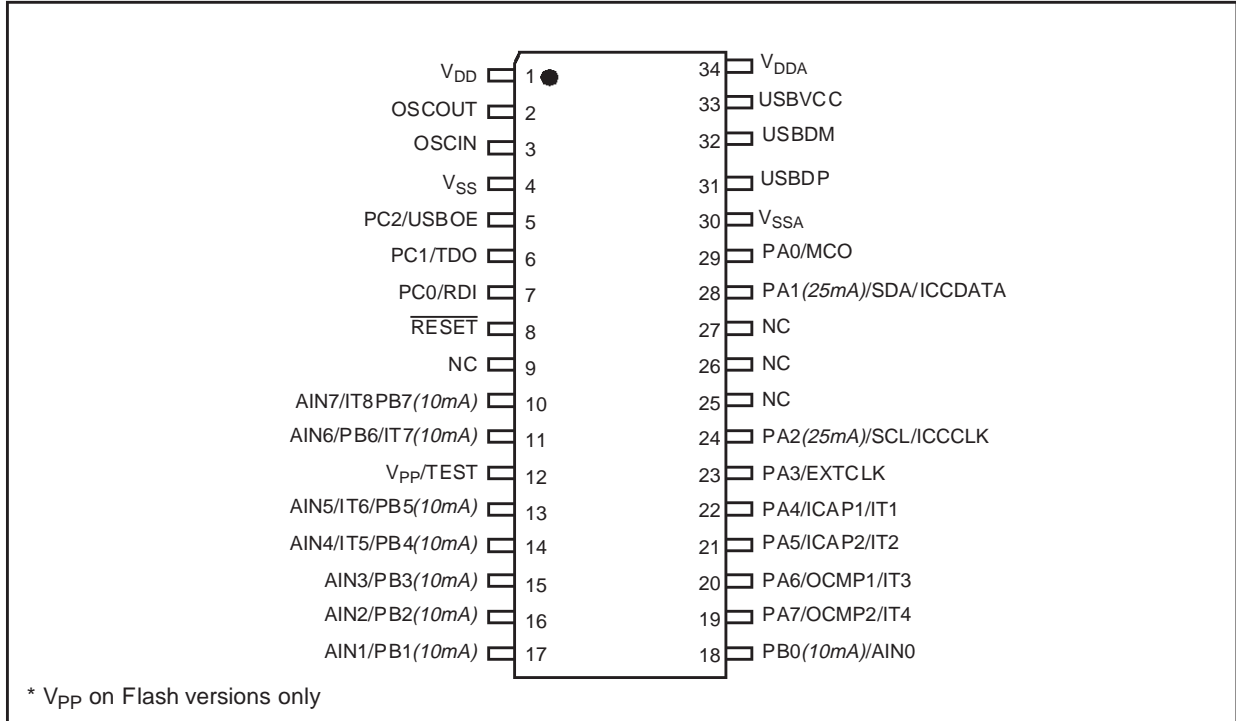

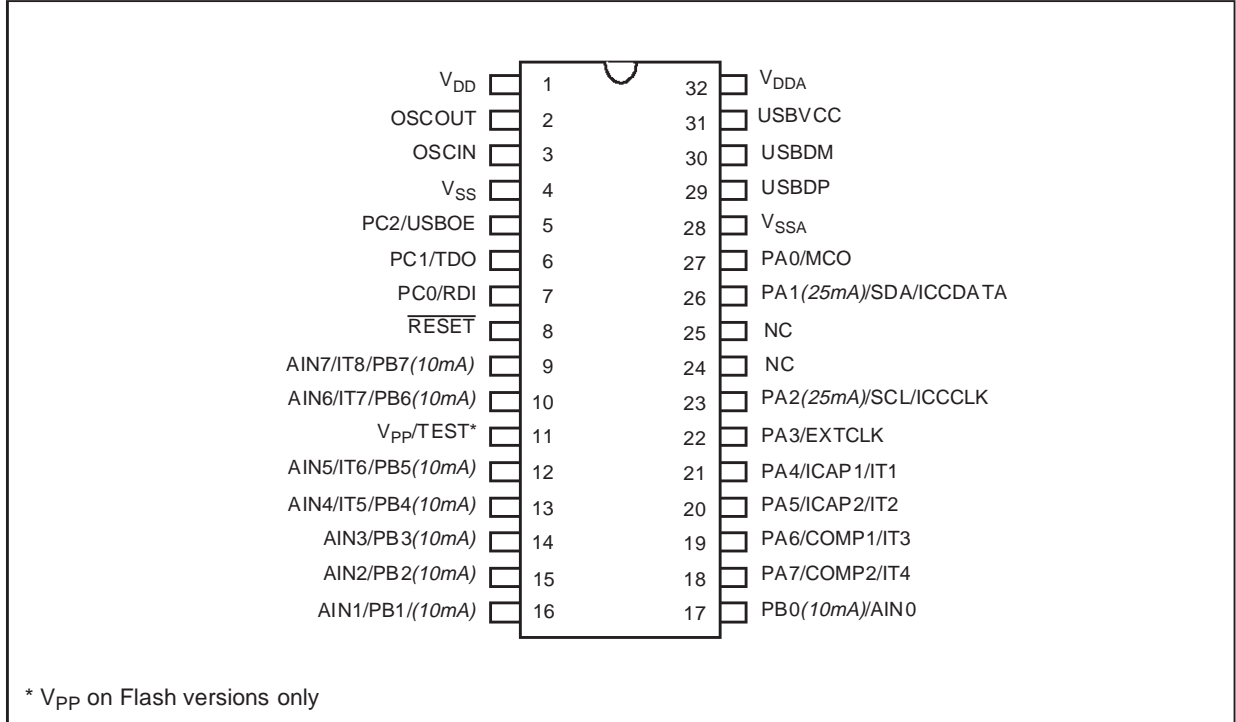

Figure 3. 32-Pin SDIP Package Pinout

**PIN DESCRIPTION** (Cont'd)

**RESET** (see Note 1): Bidirectional. This active low signal forces the initialization of the MCU. This event is the top priority non maskable interrupt. This pin is switched low when the Watchdog is triggered or the  $V_{DD}$  is low. It can be used to reset external peripherals.

**OSCIN/OSCOU**T: Input/Output Oscillator pin. These pins connect a parallel-resonant crystal, or an external source, to the on-chip oscillator.

$V_{DD}/V_{SS}$  (see Note 2): Main Power Supply and Ground voltages.

$V_{DDA}/V_{SSA}$  (see Note 2): Power Supply and Ground voltages for analog peripherals.

**Alternate Functions:** Several pins of the I/O ports assume software programmable alternate functions as shown in the pin description.

**Note 1:** Adding two 100 nF decoupling capacitors on the Reset pin (respectively connected to  $V_{DD}$  and  $V_{SS}$ ) will significantly improve product electromagnetic susceptibility performance.

**Note 2:** To enhance the reliability of operation, it is recommended that  $V_{DDA}$  and  $V_{DD}$  be connected together on the application board. This also applies to  $V_{SSA}$  and  $V_{SS}$ .

**Note** (\*): if the peripheral is present on the device (see Table 1, "Device Summary")

#### Legend / Abbreviations for Figure 2 and Table 2:

Type: I = input, O = output, S = supply

In/Output level: C<sub>T</sub> = CMOS 0.3V<sub>DD</sub>/0.7V<sub>DD</sub> with input trigger

Output level: 10mA = 10mA high sink (on N-buffer only)

25mA = 25mA very high sink (on N-buffer only)

Port and control configuration:

- Input: float = floating, wpu = weak pull-up, int = interrupt, ana = analog
- Output: OD = open drain, PP = push-pull, T = True open drain

The RESET configuration of each pin is shown in **bold**. This configuration is kept as long as the device is under reset state.
